With considerate driving, they can last a reasonable amount of time, but they don't stand up well to abuse—particularly when used to tow heavy trailers with poor brakes.. . That well not tell you much unless you can hold the coupler open then move the lever for that rear remote. One way you well get none and the other way you should get oil coming out. Always consult equipment operator's manual and follow safety instructions before operating or servicing any tractor or equipment, or attempting any task. I just replied to a thread I started last night on a very similar subject with the same type of tractor. Mr. Fedup knows his business as he nailed the problem and mine is working. Hope by now your pump has been repaired. But do a search on the internet and you should find the manual

you need. Normally they are described very well. .. The Foral platform includes forum software by XenForo. If no flow, then either the shaft is sheared off or you have lost prime. Juste got a used new holland tn75D 2004. Used it for few hours and working fine. I stop it and wen I started back the loader and 3 point hitch dont work. aboseloutely notting. It was working fine wen stop. Check the oil and is fine. I'm new to tractor. Please help. Run a hose directly from the pump OUT port into a 5 gal bucket and check for flow. / new holland tn75a four wheel drive wont engage.

JavaScript is disabled. For a better experience, please enable JavaScript in your browser before proceeding. I need advice on what manual to buy that shows pictures and instructions to remove and install the high pressure hydraulic pump on my 2003 New Holland TN75D. I am told that the Section 4 manual is the one to buy, as it covers the high pressure hydraulics. Can someone reply with the correct manual to purchase as there supposedly is a more comprehensive manual that covers. I can presse on one of the coupler not used and there is no oil or just à drop coming out. The pumps, there's two of them, are on the right side of the engine towards the front. The front pump is the one that operated the 3pth and FEL. The pump is

turning, the fluid level ok, no gauge. CAN it stop working from a stop to a start? JavaScript is disabled. For a better experience, please enable JavaScript in your browser before proceeding. If the pump is good and you activate a valve lever, something should happen, because the fluid is flowing through all the valves. If the tractor is an '03 it's out of warranty so you're on the hook for costs anyways, phone the other dealers in the area and see if anyone else has any time in their schedule. My hydraulic lift problems have been fixed, bleeding air and a new filter solved my problems. Thanks for the advice. Now, my FWD will not engage. Anyone out there have any suggestions. Someone mentioned a possible fuse problem, which fuse could it be? I think the green FWD light should come on when the FWD is engaged, it does not light up. Tractor got stuck in some slippery mud, front wheels were not turning at all, even with the positrac engaged. You should get SOME oil there, but the oil level in the tractor is well below that (or at least it should be). The pump needs to pull the fluid up there and it doesn't sound like that's happening for whatever reason. Check for in-tank filter. If it is clogged, you will have no flow. A hyd gauge would tell you if pressure is being developed. The steering works real slow. The owner

replaced pump because three point lift and frontend loader was not working when he bought the tractor. If no fluid is coming from an open ended hose, then you are not pumping. Recently purchased a New Holland TN75 with hydraulic problems. Basically loader and 3pth arms will not work. Have bled the pump and it is turning, have changed fluid which was dirty but had no schrapnel in it, and changed the filter. Pulled suction line off the base of the pump and there is no oil whatsoever, but line from rear end to hyd filter housing is full of oil and power steering pump is fine. Any help would be great. ...Thanks. new holland tn75a four wheel drive wont engage. Always consult equipment operator's manual and follow safety instructions before operating or servicing any tractor or equipment, or attempting any task. You said the pump is turning, but how do you know this. If the shaft as Leejohn mentioned is sheared off, the pump will not be turning. For a properly equipped shop and a tech who knows what they're doing I doubt it would take 2 hours to do the job. They aren't very difficult to remove, but resealing them isn't beginner DIY project. My lone New Holland tractor dealer in this area seems to believe my hydraulic pump seals are leaking. The man is so far behind and loaded with work that it will be at

least a month before they can effect repairs. Is this a tough job to handle? Is access to the pump for pulling and replacing it difficult? My TN75D is a 2003 model. The pump operates my FEL and 3 point setup. I have a cab on this machine also. I am not afraid to tackle this myself if the cab does not have to come off to fix this problem. Any advice anyone can offer would be appreciated! Thanks! Without knowing much of the previous repair history here, my first guess would be in the direction of the O rings on the inlet tubes between the filter base and the pumps. They don't usually cause problems, but then again the front pump has been off at least once so the tube has been disturbed, and there are three O rings involved right there. I believe the suction elbow is mounted with allen head bolts, and there is a loader in the way so access to see and comfortably reach everything is somewhat limited. Typically replacement pumps don't come with inlet and outlet O rings or the mounting gasket. Those can easily be overlooked until the new pump comes out of the box and then it's "oh well, the old ones don't LOOK bad", so they aren't replaced. Does the steering work? Why was the pump replaced to begin with?. You are using an out of date browser. It may not display this or other websites correctly. You should

Resource. 15/08/2020 · Tn75da all hydraulics work, can shift gears and ranges but tractor won't move forward or reverse. Shuttle is not working. Approx 650 hours only thing I've found wrong was 2. 171,709 views Feb 25, 2017

This is something that every New Holland tractor owner should know about thier tractor. Works on 12x12, 24x24 Dual command, 16x16 Electro Command... May be late but having the same problem. Did they or you ever get the issue resolved? What ended up being the culprit? Thanks.

What Is the Connection Between Mark Twain and Halley's Comet?. Ask this question on the New Holland forum. RickB could probably give you a pretty good answer to your questions. Make sure the suction line has no leaks. 00,f350 lariat,4x4,cc,drw,38r, bdp stage 2/170cc/100s, bdp live tunes,4"down 5"back, dieselsite adrenaline,diy RR w/walbro,bellowed uppies, BTS trans!. Tn75da all hydraulics work, can shift gears and ranges but tractor won't move forward or reverse. Shuttle is not working. Approx 650 hours only thing I've found wrong was 2 fuses were blown. Replaced and did not blow again. Yes there may be a dump valve involved, but it's probably not the problem as most likely it's only doing what the computer tells it to. There are two status switches that are similar to a neutral switch.

They sense what gears/ranges are selected so the computer can adjust for load when engaging the shuttle. I've seen at least one case where they were a factor in the clutch not engaging. There are so many possibilities for wiring issues it's nearly impossible to list them all. Yours is a DA model so it's probably a cab tractor? That makes things even more difficult to access for troubleshooting. 97 ECSB F-250 project truck. Current plans: 7.3, BTS, 250/2's, 468, stock bottom end. If no fluid is coming from an open ended hose, then you are not pumping. Description of your pump (include any numbers and markings):. This Professional Manual covers all repairs, servicing and troubleshooting procedures. It is very detailed and contains hundreds of pages with detailed photos & diagrams. Seems to me that I've heard few complaints with the New Holland tractors, but for the electrical problems. You're the first person I've heard from who lost an engine, especially with so few hours on it. JavaScript is disabled. For a better experience, please enable JavaScript in your browser before proceeding. That doesn't sound like the same problem at all. At least not to me. His tractor would work part of the time(when cold, apparently) and at some point would fail to move until it cooled off again. At first glance, yes, both

tractors fail to move, so that can be called the same problem. On the other hand the two situations are likely the result of two totally different issues. Well we got him to buy a new tractor. Its a 04 or 05 New Holland TN75, 3 cylinder turbo, shuttle shift, not front wheel assist though. Quick tatch loader with a bucket and bale spear. Its only got 330 hours, but its not been cared for the best so its not in the best shape. Mechanically it seems sound, but its lacking in the looks. i can't believe in this day any shop would tell a customer that it will be a month++ to effect a simple repair like that. Jimmy 97 F-250 ECLB 7.3/E4OD/4wd, 215k miles: FFD 250/200%'s, Swamps IDM, built trans, shimmed 910's, Melling LPOP, welded cam gear/modified pick-up tube, Homemade e-fuel/intake/exhaust/traction bars, D66, Built and tuned by me. That well not tell you much unless you can hold the coupler open then move the lever for that rear remote. One way you well get none and the other way you should get oil coming out. Getting a service authority involved should help. Surprised they haven't done so sooner. That broadens the scope. These people get to hear about such problems from all over, not just your local dealer's area. A forum community dedicated to Ford Power Stroke owners and enthusiasts. Come join the discussion

Outdoor Hub, LLC (d/b/a Carbon Media Group), 30800 Telegraph Rd, Suite 1921, Bingham Farms, MI 48025 USA. The Fora platform includes forum software by XenForo. But, I blame the heads of the engineering departments for putting up with this crap. The people in those positions are likely YES MEN. ...which is exactly the

type of men the bean counters are looking for. I have a New Holland TN75DA with power shuttle trans. It is going back to the dealer for the 3rd time for the same problem, tractor has only 2000 hours on it and after running it for an hour more or less the trans fails to shuttle to forward or reverse. It will attempt to move then it feels like the hydraulic pressure is released from the clutches. When reset with the hand shuttle or foot clutch it momentarily engages and moves a few inches then nothing, no codes. Let it sit overnight or for several hours and all is normal. Dealer has replaced the ECM, some diode in the harness, some pressure sensors and the seat. \$3,000.00 in repairs so far and problem is still the same. I have full shop manual which indicates you need the proper software and interface to program this computer and calibrate it. Unfortunately there is only one dealer anywhere near me, wondering if anyone else has had a similar issue with this trans., there is an item called a dump valve next to the forward and reverse solenoids I wonder if that could be the problem? The dealer is attempting to get the Regional Dealer Assistant involved by more than just phone calls but this has been going on for 1 1/2 years!!!! Any experience or thoughts would be appreciated. Rodger. The History and Impact of Women's

VerticalScope Inc., 111 Peter Street, Suite 600, Toronto, Ontario, M5V 2H1, Canada.

Fedup, Can't disagree with anything you said and yes it is a cab model. I would have been happy to have the manual shuttle but I wanted a cab model since it is going to end up in Maine but of course you have to have the upgrade trans. It seems harder and harder to get a reliable machine these days and trying to work on it is near impossible without some of the dealer equipment. The dealership is supposedly the oldest Ford dealer in the country but are on the smaller side. It also does seem it is some calibration issue or some sensor since even though they replaced the ECU it does the same thing and I do not think they have a proper diagnosis. One of the reasons I am reaching out on this forum is in an effort to find someone who experienced the same issue. Thank you for your time.
