Early or excessive movement of the shoulder following surgery. Seroma is the most common surgical complication after breast surgery. It is due to the presence of rich lymphatic system in the breast, low fibrinogen levels in lymph fluid and potential space creation in the breast after surgery, which contributes to seroma formation. Seroma is more common in older and obese people. [7]. A seroma is a fluid-filled pocket that can develop after breast surgery. OUR BRANDS Healthline Medical News Today Greatist Psych Central. A liposarcoma is a rare type of cancer that develops in fat cells. The most common kind grows slowly, but some types spread easily throughout the

body. Read more here. The fluid that causes a seroma, called serum, leaks out of damaged blood vessels and vessels of the lymphatic system, causing swelling and a lump that looks like a large cyst. Seromas vary in size and they can take up to a year, in some cases, to go away. (1).

A seroma is a deposit of lymph formed in the body in response to surgery or physical trauma. These deposits are very common after surgery and they often resolve on their own. If a deposit is large or causes discomfort, it can be drained by a care provider. This side effect is especially common after mastectomies or procedures where lymph nodes are removed.

Fluid extractions: The vet will use a large needle and syringe to extract as much fluid as possible. This is not always an efficient method as the body may start generating new fluid as soon as the old one is removed.

Seroma is a common complication of surgical procedures that create a cavity where fluid can collect. Seroma formation may occur due to fluid leaking out of the lymphatic vessels, or it may be the result of infection or breakdown of the surgical site. Although it's common for seromas to resolve on their own, you should keep your doctor or health care provider updated about the status of your seroma. If it does not improve after a month, let him or

her know. If the amount of fluid in the seroma seems to be increasing, the swelling increases or it is painful, you should contact your doctor right away so that it can be drained and an infection can be ruled out. Lymphocele: This refers to an abnormal buildup of lymphatic fluid following a surgical procedure. *Methods of Cancer Diagnosis, Therapy and Prognosis: Breast Carcinoma*. Springer Science & Business Media. p. 562. ISBN. Even though drainage tubes are typically used in and around an incision to remove fluid and prevent a seroma, sometimes some fluid remains after surgery and over time it can cause a seroma. Or a seroma can occur if drainage tubes aren't used during surgery and the fluid has no place to go. *Pain-Relieving Procedures: The Illustrated Guide*. John Wiley & Sons. p. 397. ISBN.

Essentials of Breast Surgery: A Volume in the Surgical Foundations Series. Elsevier Health Sciences. p. 177. ISBN.

Heat is an excellent form of treatment for promoting the reabsorption of a seroma. Heat typically causes the blood vessels to widen, known as vasodilation. It also can assist in stimulating the flow of blood and lymph fluid around the seroma site. Not only does better blood flow carry healing properties, including the formation of tissue, but widened blood vessels facilitate the reabsorption process, making it

easier for the seroma serum to drain into the vessels. Apply heat by dipping a towel or gauze pack into a bowl of clean, warm water. Wring out the excess water. Then, apply the moist material to the irritated area. When the material loses its heat, dip it into the warm water again and repeat the process. Do this a few times each day, for 10 or 15 minutes at a time.

age breast size presence and number of cancerous nodes in the armpit previous biopsy surgery use of drugs called heparin or tamoxifen. In most cases, seromas are harmless, and doctors let them heal naturally. They are not related to cancer cells and pose no increased risk or concern. However, they. It can be scary to experience any type of complication after surgery, but you may be happy to hear that there are safe and natural seroma treatments that you can do at home. With the help of your surgeon or health care provider, you'll be able to reduce your chances of complications and enable your seroma, and surgical incision, to heal properly. Steroids are sometimes used to reduce the inflammatory response to surgery that's thought to lead to seromas. Research in the World Journal of Surgical Oncology notes that putting steroids into the surgical wound after breast reconstruction or the first day after a mastectomy with sentinel lymph

node biopsy has been shown to cut the risk of seroma development, but a dose of steroids before mastectomy or after mastectomy with axillary lymph node removal didn't seem to change the odds. The use of steroids may also raise the risk of bacterial infection of seromas. Secret Detox Drink Recipe (A Natural Detox Drink Recipe). A seroma may be formed in response to physical trauma. Surgical Pitfalls - Prevention and Management. Saunders. pp. 523-529. doi: 10.1016/B978-141602951-9.50066-9. ISBN. In many cases, a seroma can reabsorb back into the body without treatment. However, if your seroma causes you pain or if it strains against the stitches at the incision site, you may require treatment. Getting massages frequently has a similar effect as applying heat via a warm compress; both methods stimulate blood flow. Massages also benefit the lymphatic system, which plays an essential role in seroma serum reabsorption. Ideally, you will use a warm compress simultaneously as the massage. It is best to only touch the actual site of the seroma with the warm compress material, not your bare hands. Only massage the area around the seroma.
