California night sky tonight. All of the California deserts are located in eastern Southern California. American Indians were the first humans in the California desert. The highest temperature ever recorded on the surface of the earth is 134 degrees Fahrenheit. The start of the new decade ushers in a celestial medley of stargazing events to look forward to. Are you ready for a new year of supermoons, meteor showers, eclipses and historic planetary alignments? The year 2020 is filled with a number of events. Learn about the two wildfire seasons in California. California became the 31st state to join the Union in September of 1850, and is famous for the Gold Rush that occurred in the 19th century, which is the origin of the state's nickname, the Golden State. From multiple meteor showers to a Hunter's Moon, here's what to spy in the heavens above this month. With crackling leaves underfoot and shorter days on the horizon, it's time to stow away the summer gear, break out the sweatshirts and make the most of the season. California's mountains include many of the highest peaks in the world.

the country, including Mount Whitney, the highest summit in the contiguous United States. The state is home to numerous mountain ranges, inc There is no state in the nation quite like California. It has a unique history, a beautiful landscape, and quite a lot of diversity. Did you know that over a quarter of the state's population is an immigrant to the United States? Or that it. As of July 2011, California had 482 incorporated cities, with 121 charter cities and 361 general law cities. Three counties lack any incorporated areas whatsoever, including Alpine, Mariposa and Trini Venus is the brightest planet in the night sky. It is the second-brightest object visible to the naked eye after the moon and is visible in the hours just before sunrise and after sunset. These hours iCandi Apps makes a series of popular star gazing apps designed to let iPhone owners discover constellations, stars, planets, satellites, and more iCandi Apps makes a series of popular star gazing apps designed to let iPhone owners disco. We all own the starry sky, but only a few people get to do what they want with it. The last thing you probably think about when gazing up at a starry sky is who owns it. After all, it's you and me, right? Let's get on with wishing and dream.. If you missed the Draconids, no worries, as this is the best sky-watching

event in October. The Orionids meteor shower, created by debris left behind by Halley's Comet, is set to peak in the pre-dawn hours of Oct. 21. As many as 25 meteors will be visible each hour. 'First Light Night' for oldest professional telescope in U.S. (April 14). But what about companies and individuals with the means to rattle the stars independently of nations? Consider this recent statement from SpaceX chief financial officer Bret Johnson:.

National 401(k) Da: What's the Maximum Amount You Can Contribute to a 401(k)?.

From June 2018 to November 2019, the plucky little spacecraft surveyed the near-Earth asteroid Ryugu utilizing a scientific payload that included four small surface rovers. In addition to surface samples, Hayabusa 2 also collected subsurface material by deploying a free-flying gun with one impactor "bullet." After the bullet struck Ryugu, the spacecraft descended and retrieved samples from within the impact crater. As of July 2011, California had 482 incorporated cities, with 121 charter cities and 361 general law cities. Three counties

lack any incorporated areas whatsoever, including Alpine, Mariposa and Trinity counties. Of the 482 cities, 439 gained population in 2014. Treehugger is part of the Dotdash Meredith publishing family. California tends to cycle back and forth between the two wildfire seasons. Studies have shown that wildfires are rare during May, but they do pop up from time to time. Some cities in California are on wildfire watch all year round because the temperatures, winds and other climate conditions provide the ideal conditions for fires. Are Wildfires Getting Worse? If you're lucky to live somewhere without light pollution, you might see it with your eyes alone, but even then it'll appear as a dim speck of light. Grab a good pair of binoculars and locate this distant world by looking for the front of the constellation Aries. But, let's face it, there really should be a limit on how many things we cram into that sky— and who gets to do it. Space is our planet's home and its wonders help us get outside and foster an appreciation of nature. Exploring space and the cosmos can also help us learn about what's happening on Earth. Space-based technologies have helped us better understand climate change, water cycles, and even air quality. This Weekend's 'Super Blood Flower Moon' Lunar Eclipse Promises a

Dazzling Show. Spend your Halloween evening gazing up at the sky to see the largest planet share the same right ascension with the moon. Depending on your time zone, this close approach will occur as dusk fades above the southwestern horizon. The moon and Jupiter will still be too far apart to view through the lens of a telescope, but you can watch this cosmic cuddle with your naked eyes or binoculars. The Cincinnati Observatory, established in 1842, is the nation's oldest professional observatory. But should you be able to claim something simply because you have the technical ability to do so? Ask colonized peoples throughout history what they thought of that idea. What is the Best SUV for Seniors in 2022?. How Much Do You Really Know About the State of California?. How Many Mountains Are There in the World?. Christian Cotroneo is the social media editor at Treehugger. He is a founding editor at HuffPost Canada, and former writer at The Dodo and Toronto Star. What to See in the Night Sky for April 2022. Finding something as simple as the Moon was challenging with the mini tripod because I'd locate the Moon, turn the focus wheel, and lose it from my field of view. On the MiniScope itself, there's a lot of resistance when rotating the lens to focus it, another factor that made the MiniScope

frustrating to use because it results in movement. Take advantage of any clear night to grab a pair of binoculars, a telescope or just look up and marvel at this rusty-orange giant. Mars won't look this good or come this close again until Sept. 15, 2035. "Since 2002, we have been at the forefront of revolutionizing space technology, with a solid track record of success, strong customer relationships and more than 70 future launches on our manifest, representing over \$10 billion in contracts. Furthermore, with over \$1 billion incash reserves and no debt, the company is in a financially strong position and is well positioned for future growth.". The Night Sky MiniScope is made from a brushed aluminum that matches the aluminum finish on the iPhone. It's much smaller than a standard telescope and is compact enough to fit into a backpack or a large purse, so it can be taken along on a hike or a camping trip. It's not going to fit in a pocket or anything, but it's more portable than the average telescope. It measures in at 2.44 inches in diameter and 8.86 inches in length, and is about the size of a 16-ounce soda bottle. It weighs just over a pound, so while it can add a decent amount of bulk to a small pack, it's not adding a lot of weight. Despite the lightness, it's a well-made and sturdy product that has a high-quality look

and feel. What to See in the Night Sky for October 2021.

Mercury rise and set in Yucca Valley Fairly close to the Sun. Visible only after sunset. Mars rise

and set in California View in the early morning. Neptune  
Thu 7:26 pm Fri 7:21 am Fri 1:24 am Slightly difficult to see.  
(opens in new tab) Sunday, September 4 will offer a fine  
opportunity to view the spectacular, mountain chains,  
actually segments of the old basin's rim, that encircle the  
rim of Mare Imbrium. The most northerly arc of mountains  
is the Lunar Alps, or Montes Alpes. Binoculars or a  
telescope will reveal a slash cutting through them called  
the Alpine Valley, or Vallis Alpes, where the moon's crust  
has dropped between parallel faults. To the lower right  
(lunar southeast) of the Alps are the Caucasus Mountains,  
or Montes Caucasus. That mountain range disappears  
under a lava-flooded zone connecting Mare Imbrium with  
Mare Serenitatis to the southeast. The southeastern edge of  
Mare Imbrium is bordered by the lengthy Apennine  
Mountains, or Montes Apenninus. They sink out of sight  
near the prominent crater Eratosthenes. The Montes  
Carpatus ring the south, near crater Copernicus. On the  
opposite side of the mare is the distinctive, round Sinus  
Iridum, the Bay of Rainbows. Monday, September 5 - Venus  
Veers past Regulus (before sunrise). 2012 2013 2014 2015  
2016 2017 2018 2019 2020 2021 2022 2023 2024 2025  
2026 2027 2028 2029 2030 2031 2032. Editor's note: If you

have an amazing skywatching photo you'd like to share for a possible story or image gallery, please contact managing editor Tariq Malik at. Jupiter rise and set in Yucca Valley Up most of the night. October 14 and 15 mornings: Moon near Mars and Pleiades. Moon near Mars September 16 and 17 mornings. Night sky, September 2022: What you can see tonight [maps]. Neptune rise and set in California Up almost all night. Use binoculars. Neptune is roughly in the opposite direction of the Sun in the sky, and is, therefore, visible most of the night. This is the best time of the year to view the planet. Very faint, use binoculars. Neptune Thu 7:34 pm Fri 7:25 am Fri 1:30 am Slightly difficult to see. Oops! Something went wrong while submitting the form. Jupiter is roughly in the opposite direction of the Sun, so it is visible during most of the night. Saturn Thu 5:32 pm Fri 4:57 am Thu 11:14 pm Perfect visibility. Planet Sizes and Order How large are the planets and what is their order from the Sun?. Looking for a telescope for the next night sky event? We recommend the Celestron Astro Fi 102. Uranus rise and set in Yucca Valley View in the early morning. Bring binoculars. Uranus can be seen for more than 9 hours during the late night/early morning and until sunrise. You may need binoculars. Jupiter shines brightly in

the southeast as October evenings begin. That's because it reached opposition- when Earth flew between Jupiter and the sun- on September 26. The bright planet lies directly south of the eastern side of the Great Square of Pegasus, a large square pattern in our sky with 4 fairly bright stars marking its corners. Between the Great Square and the bright planet is a pretty, but faint group of 6 stars known as the Circlet. They comprise the western section of the constellation Pisces. Chart via John Jardine Goss/ EarthSky.

Mercury Thu 8:12 am Thu 7:59 pm Thu 2:05 pm Very difficult to see. The sun-centered charts below come from Guy Ottewell. You'll find charts like these for every month of 2022 here, in his [Astronomical Calendar](#). Guy Ottewell explains: [Tonight's Sky in Los Angeles, Sep 15- Sep 16, 2022 \(7 planets visible\)](#). (opens in new tab) When the moon completes the first quarter of its journey around Earth on Saturday, September 3 at 2:08 p.m. EDT or 11:08 a.m. PDT and 18:08 GMT, its 90 degree angle away from the sun will cause us to see the moon half-illuminated - on its eastern side, and shining near the brightest star of Scorpius, red Antares. At first quarter, the moon always rises around midday and sets around midnight, so it is also visible in the afternoon daytime sky, too. The evenings surrounding first

quarter are the best ones for seeing the lunar terrain when it is dramatically lit by low-angled sunlight, especially along the terminator, the pole-to-pole boundary that separates the lit and dark hemispheres. Sunday, September 4 - Mare Imbrium Mountains (evening). Venus Fri 5:44 am Fri 6:30 pm Fri 12:07 pm Slightly difficult to see. As evening falls in September 2022, watch for bright golden Saturn just above the southeastern horizon. Saturn's opposition, when we flew between Saturn and the sun, was on August 14. So it's in a wonderful place to see now, ascending in the east in the evening, as seen from around the globe. In addition, if you have a dark sky, you can also see that Saturn shines in the dim, but pretty constellation Capricornus the Sea-goat. Notice that Capricornus has the shape of an arrowhead. Indeed, you can see them crossing the sky all night, traveling along the ecliptic, the same path the sun travels during the day. Chart via John Jardine Goss/ EarthSky.

Welcome to our night sky monthly feature where we focus on easy and fun things to see in the night sky mostly with just your eyes. This month, planets throughout the night and some easy star patterns to identify. Mars can be seen for more than 7 hours during the late night/early morning and until sunrise. Night Time 11 hours, 47 minutes Thu, Sep
